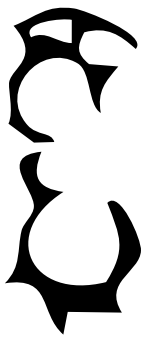
SIGNAGE

AS22*wr 02/18/25-03/04/25



3)

Signage and wayfinding systems became another interest in my researching, and I tried to relate marks to the symbols we see on every day objects like signs.

4)

With that in mind, I recreated a caution sign with one of my many marks and compared the two to show that they're symbolically similar and conveying the same message.

5)

Similar to everyday symbols, I recreated a logo using another mark, which was the butterfly used by Microsoft's MSN

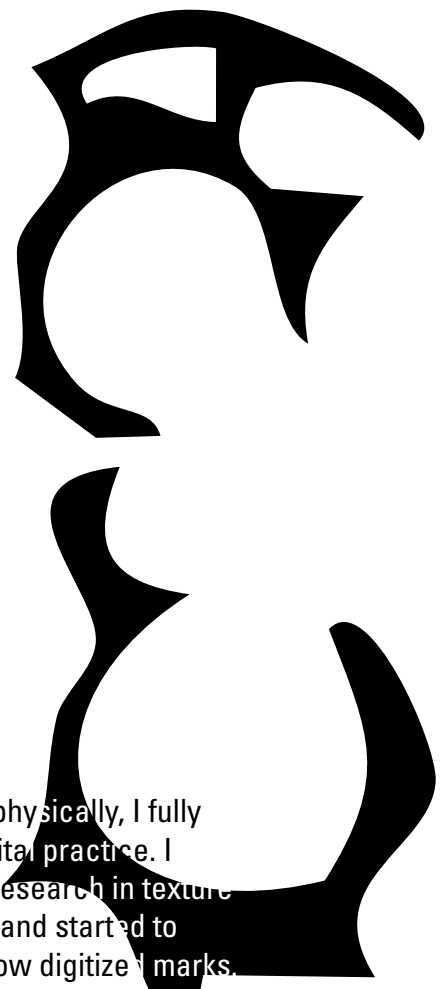
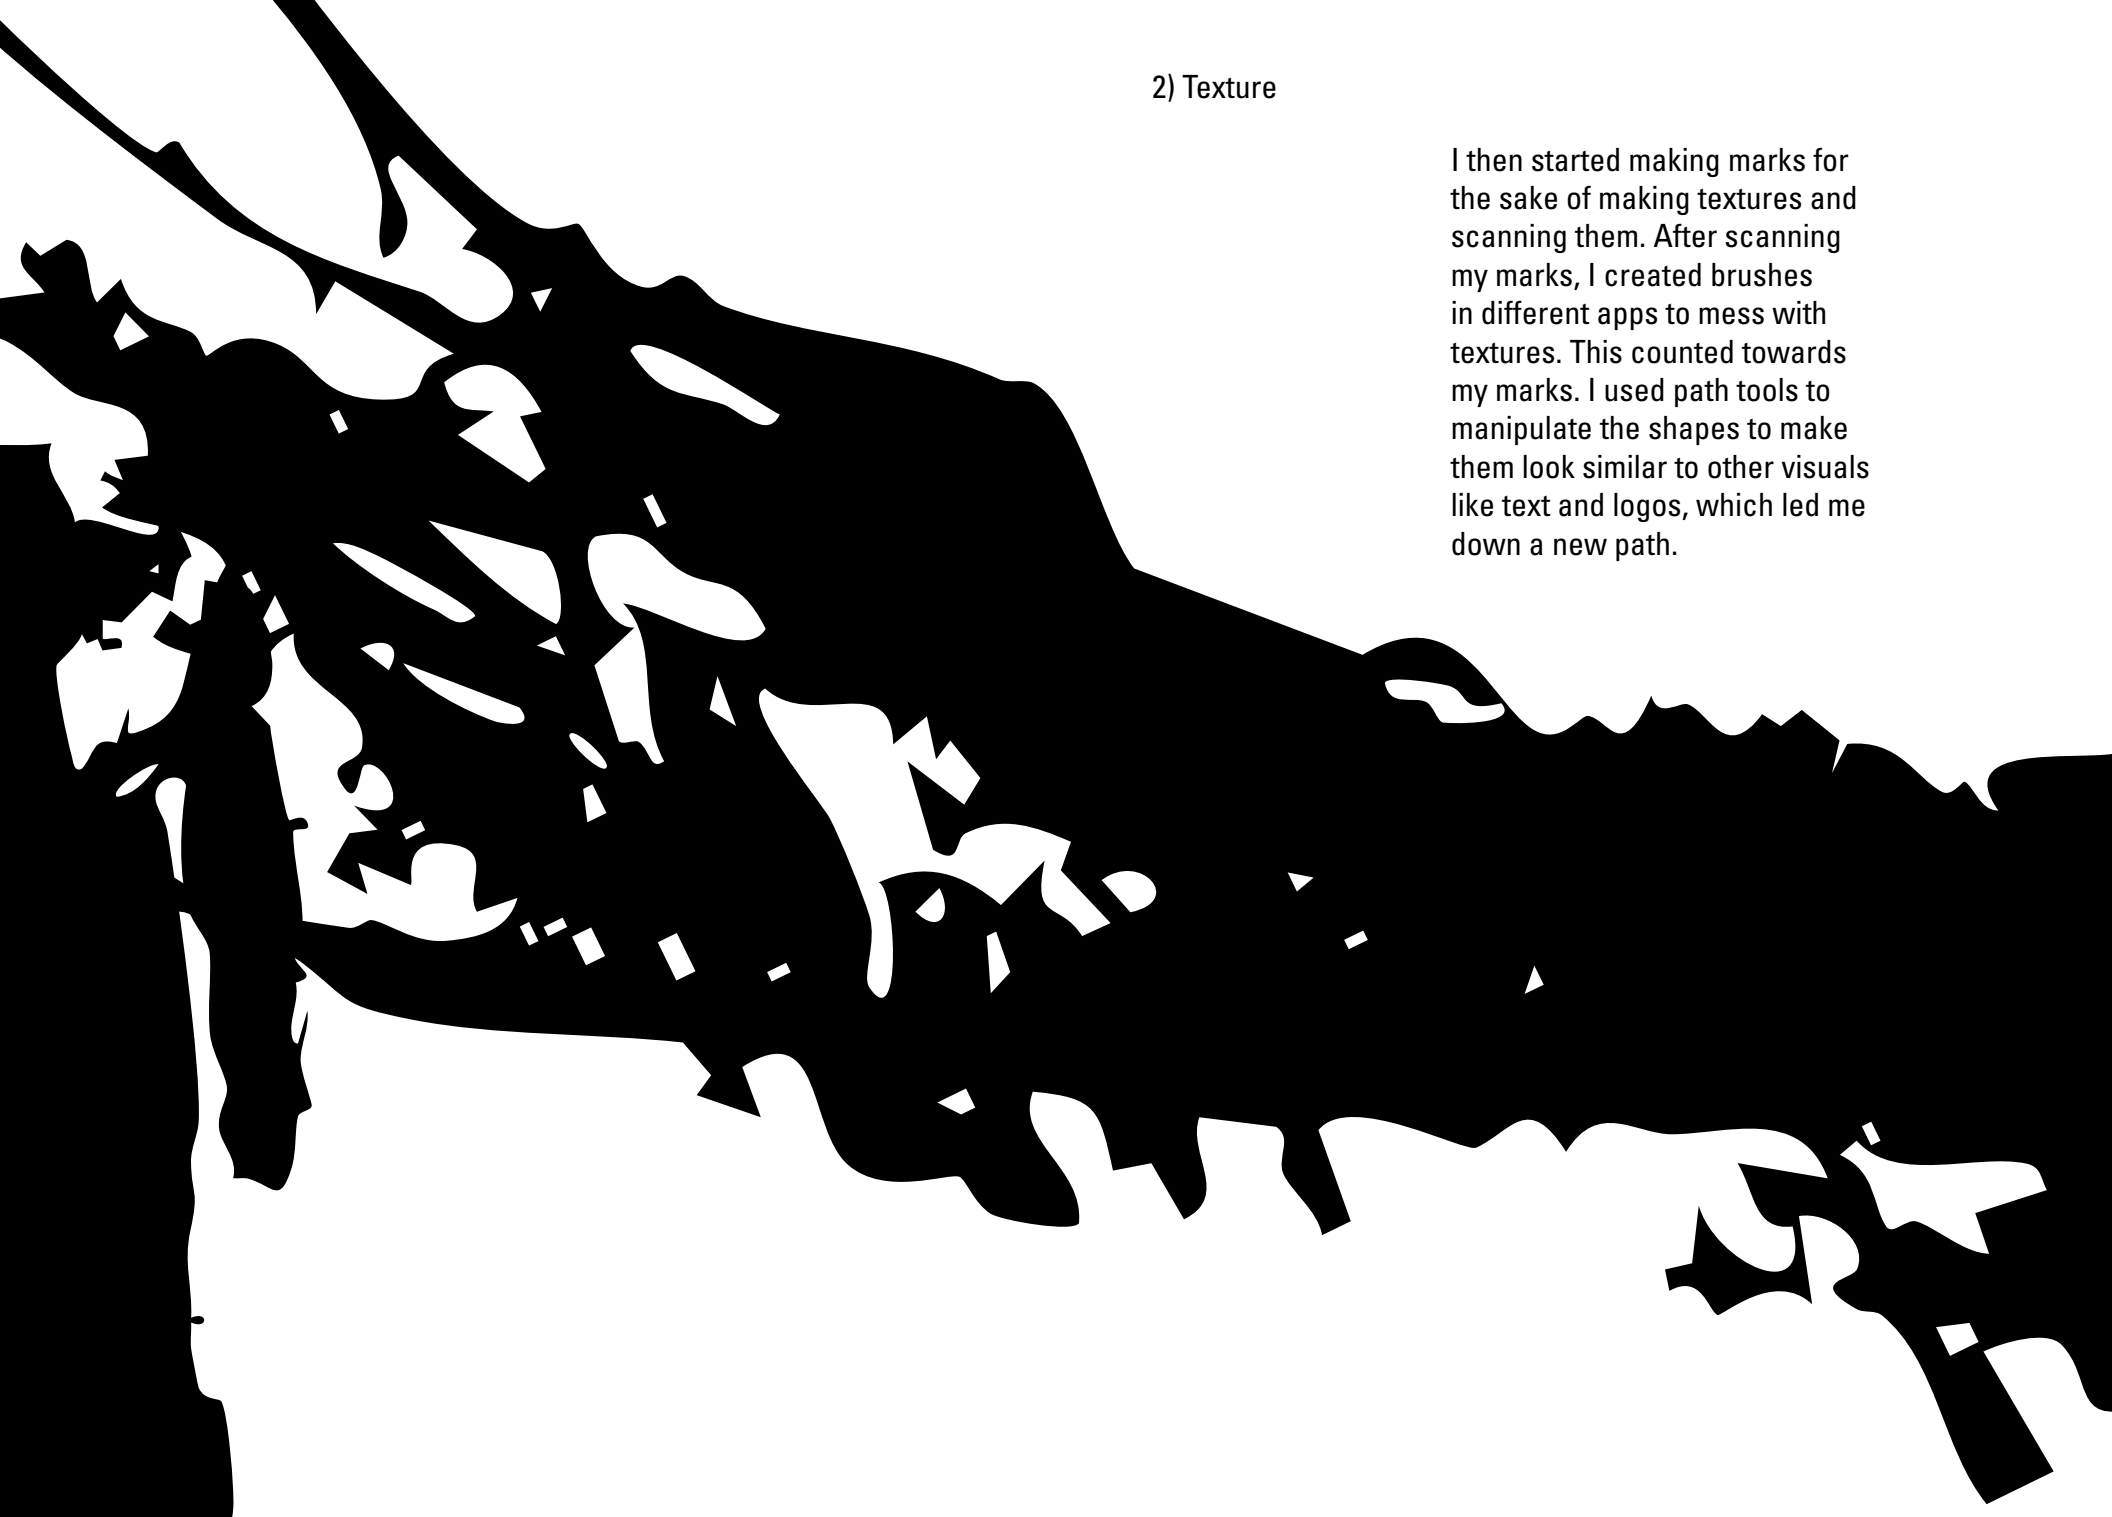
1) Digital Process

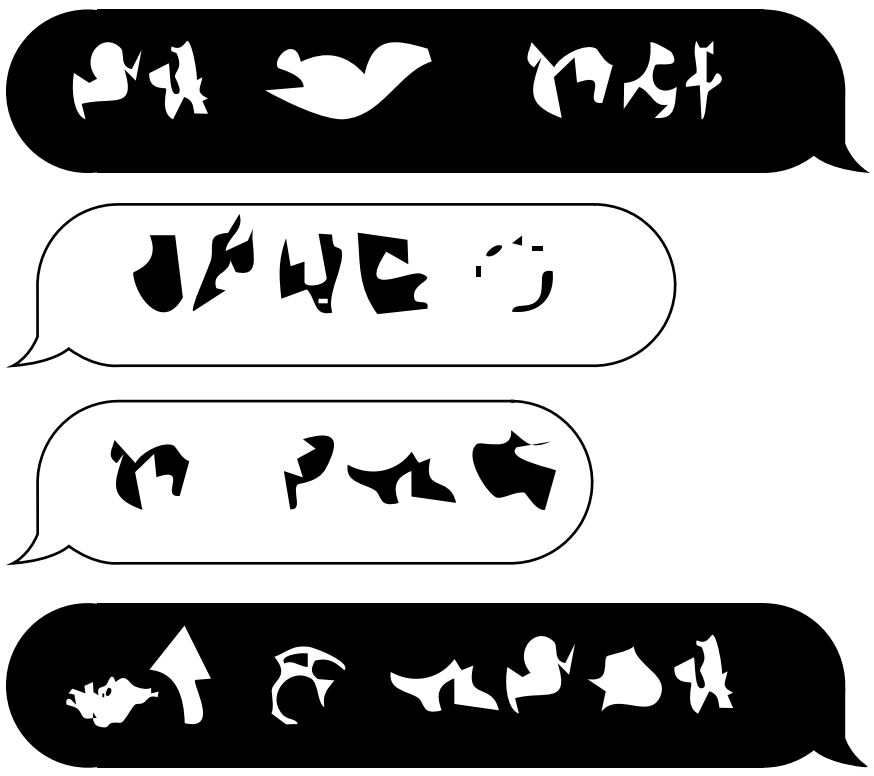
After working physically, I fully moved to a digital practice. I continued my research in texture related works, and started to play with my now digitized marks. They were cleaned up, but still showed their distorted nature.



2) Texture

I then started making marks for the sake of making textures and scanning them. After scanning my marks, I created brushes in different apps to mess with textures. This counted towards my marks. I used path tools to manipulate the shapes to make them look similar to other visuals like text and logos, which led me down a new path.



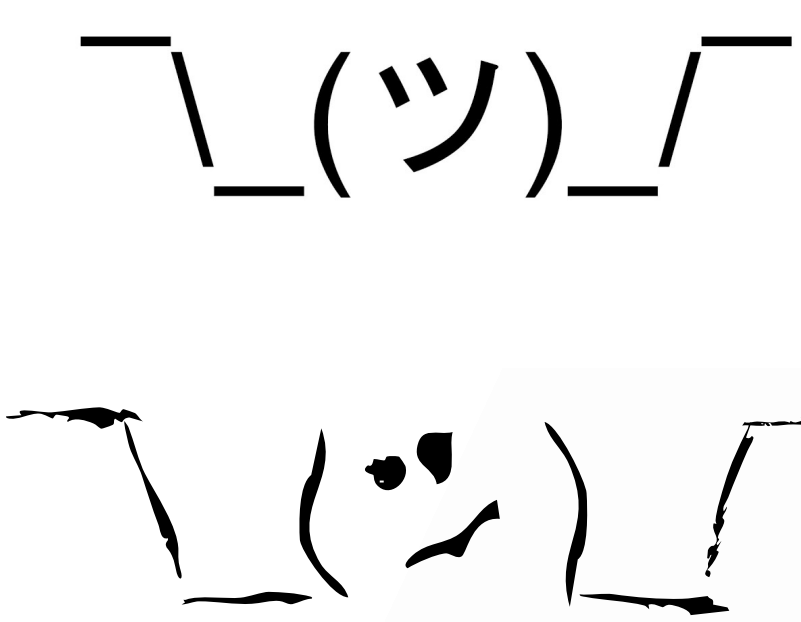


1) Communication as means to mark-make

I continued my research, which pushed me in a few different directions which all differed how I saw or used my marks. During our class-wide discussion of asemic writing, I researched “grawlix.” This is the offical term for the symbols used in comics or cartoons to censor or replace profanity. This fledged out the idea for asemic writing for me and gave more sense in a practical use.

After grawlix I started to look at emoticons and early internet ASCII art and related its primitive makeup (typographic symbols) to my mark making process. Without creating compositions, you can still make images that communicate ideas or feelings directly.

2) Below is classic ASCII art remade from my marks



1) Corrosion 02-09-2025

In the start of the mark-making process, I found myself most interested in the idea of “corrosion” or degredation of my object. I put a piece of my object in nail polish remover for a month, and this slowly broke down the plastic and polished it.

****

2) Digital Corrosion 02-20-2025-Present

To flesh out the idea of corrosion, I took it in a digital direction as well. By distorting and warping images of the object I created some textures that were made to look like rust, mold and grain to continue the theme.
