Keyboard/Keyboard

Keyboard/Keyboard

Keyboard/Keyboard is an interactive web-based program hosted completely on browser. It was made between January and February of 2026 by Michael Wynne for Core Studio IV.

There are 3 important things to remember when approaching Keyboard/Keyboard.

1. Keyboard/Keyboard is interactive.
2. Keyboard/Keyboard translates.
3. Keyboard/Keyboard is a machine.

Keyboard/Keyboard's name is a reference to the idea that a keyboard (instrument) and a keyboard (computer peripheral) can be work at the same time in a computer.

Keyboard/Keyboard is an open song-writing program that allows for a song creating process without traditional methods. As you type into the text box, the notes ring with your keystrokes. This leaves room for sonic experimentation, no prompting or need for harmony or earworm-y melodies.

Keyboard/Keyboard breaks down the traditional song writing process, and creates an open THING to write songs through using formalized language and words. Each key and each letter are mapped with a different note, which leads to the creation of undiscovered songs through collections of words.

What is the means of translation?
Keyboard/Keyboard's means of translation can differ depending how you use it. Are you trying to transcribe an existing song? You're translating the song through letters on your keyboard. Are you writing about your day? You could be translating your emotions into a collection of notes that some may even call a song.
(Only if its good though.)

Try it for yourself at:
